# Our key services

## Assessment

We can provide assessment services to meet your needs throughout the life of your project. Environmental assessment are critical in the early stages of the development process, but there is often a role for assessments during and after a project as well. They provide us with the information and tools to make decisions about particular environmental issues.

Because we provide personalised service, you can be sure we'll work closely with you and recommend solutions for any challenges that may be identified. You will have access to our expertise, network and innovative approaches, which will help achieve your project needs faster and with less stress.

Our assessment capabilities include impact assessments for DAs, EPA Licence applications and other approvals, environmental constraints and opportunity analyses, waste classification reports (including VENM reports) and contaminated land assessments.

## Management

Once environmental impacts and risks are identified, procedures should be put in place to manage them. Many developments need their management strategy and procedures formalised in written documents. In addition to guiding activities of the development, these written management plans are important tools for communicating with regulators, customers and other stakeholders. We can help develop these management strategies and procedures. We will ensure the management approach addresses all relevant environmental aspects, but is also practical and economical.

We can provide a one-stop-shop for project management of your development consent and other environmental approvals. This includes training your staff in environmental issues, with a package tailored to your business. We can also assist you with applications for government grants and stakeholder/community management.

Our management capabilities include environmental management plans and systems (EMS), construction environmental management plans (CEMPs), pollution incident response management plans (PIRMPs), landfill environmental management plans (LEMPs) and stakeholder management plans.

## Monitoring

Monitoring allows us to directly measure, analyse and identify trends. Environmental monitoring is often required to assess performance or compliance with project approvals. Monitoring may also help meet your due diligence and risk management goals, or help identify whether your environmental mitigation investments are paying off.

We can conduct a one-off investigation or recurring monitoring at your site(s) for a range of environmental aspects. We can also design, commission and operate monitoring systems that will be in place for longer periods of time.

## Audit

An environmental audit gives you a thorough understanding of the environmental performance and compliance aspects of your project. An audit generally involves a desktop review, site assessment and audit report, including recommendations for improvement.

4Pillars' audit reports go even further – they include an innovative risk reduction strategy, that helps you determine the most efficient way to allocate resources to achieve a particular goal. We want our audit reports to be the ultimate environmental decision-support tool, rather than a just another document that sits on a shelf.

## Our commitment to sustainability

4Pillars believes in leading by example. We are committed to sustainable business operations and demonstrating the opportunities and benefits that flow from sustainable business practices. Please see full details of our sustainability plan on our [webpage](#).
